Be Right: Payment pipeline

Two options: A without the Whish API, B with it · Proposal, 15 October 2026 · Not built yet

The idea: every job ends with an invoice; cash and Whish are only ways to pay it. **Option A** (first part): the money moves outside the site and the office confirms each Whish payment by hand. **Option B** (second part): the site is connected to Whish, makes a payment link for each invoice, and Whish's confirmation marks it Paid by itself. Invoices, cash, parts and reminders are the same in both.

Option A: without the Whish API

Every invoice ends Paid, and only the office confirms a Whish payment

1. One-time setup (Admin → Settings)

- **Be Right's Whish business account:** its Whish number and QR code image, shown on every invoice.
- **Invoice details:** company name, address, tax number, numbering (BR-0001, BR-0002…), currency (USD, or USD + LBP), VAT on or off.
- **Payment methods on:** Cash and Whish. Card can be added later.

2. Two separate statuses on every job

- **Job status (unchanged):** Submitted → … → Completed or Cancelled.
- **Invoice status (new):**
  - **Unpaid:** invoice sent, nothing paid yet.
  - **Payment to confirm:** someone reported a Whish payment; the office hasn't checked it.
  - **Partly paid:** part received, a balance is left.
  - **Paid:** fully received and confirmed.
  - **Void:** cancelled by an admin with a reason. Kept, never deleted.
- A job can be **Completed** and still **Unpaid**: normal for customers who pay later.

3. When the invoice is created

Situation	When	Lines on the invoice
Normal repair	The technician taps Done	Agreed price + approved extra work + parts used
Emergency	The technician taps Done	Price agreed on the phone + parts. No price entered yet: the invoice waits and the job shows "Price missing"
No repair	The specialist closes with the visit fee	$10 visit fee only
Guarantee visit	Done	$0, marked Paid automatically (kept on record)

- Numbers are given in order and never reused.
- A mistake is fixed by voiding the invoice and issuing a new one. A sent invoice is never edited.
- The customer gets it by email and sees it in **My requests** with **Download PDF** (English and Arabic).

4. How the customer pays: four ways

A. Cash to the technician on site

1. The technician opens **Collect payment** on the job: the amount due shows.
2. They take the cash and tap **Cash received: $X** (a partial amount is allowed).
3. The invoice becomes **Paid** (or Partly paid); the customer gets a receipt by email, and the technician can share it on WhatsApp.
4. The money is now **held by the technician** (section 6).

B. Whish on site

1. The technician shows Be Right's **Whish QR code** (or number) on their phone.
2. The customer pays in their Whish app and writes the invoice number (BR-0042) as the note.
3. The technician taps **Customer paid by Whish**.
4. The invoice becomes **Payment to confirm**, not Paid: the technician can't see Be Right's Whish account.

C. Whish later, from home

1. The invoice page shows: "Send $45 to Be Right on Whish, number XX XXX XXX, note BR-0042", with the QR code.
2. The customer pays, then taps **I've paid** (optional: the Whish reference or a screenshot).
3. The invoice becomes **Payment to confirm**; the office gets an email.

D. The office sends a Whish request

1. From the Whish business app, the office sends a payment request to the customer's phone number.
2. In Be Right they tap **Whish request sent**, so the team knows it was asked.
3. When the money arrives, they confirm it (section 5).

5. The office confirms Whish payments (Payments tab, specialists and admins)

1. **To confirm** lists every reported Whish payment.
2. For each: open the Whish business app and find the payment by amount, time and the BR-number note.
3. **Confirm** and type the Whish transaction reference: the invoice becomes Paid, the customer gets a receipt.
4. Or **Not found**: the invoice goes back to Unpaid and the customer is told.

- **Only an office confirmation counts as paid by Whish.** A screenshot is never enough (it can be faked).

6. Cash held by technicians

- The Payments tab lists each technician with the cash they hold, invoice by invoice.
- When a technician brings cash to the office: **Cash received from [name]: $X**. Their balance goes back to zero.
- The technician sees their own balance in the app ("You hold $120 for Be Right").
- Every step is logged: who, when, how much.

7. Unpaid invoices

- **Unpaid** list, oldest first: customer, amount, days waiting, phone (tap to call or WhatsApp).
- Automatic reminder email after a set number of days (for example 3 and 7), with the Whish instructions.
- **Write off** (admin only, with a reason) for money that will never come.

8. Spare parts

1. Before tapping Done, the technician adds **Parts used**: name, price paid, photo of the shop receipt.
2. If the parts raise the total above the agreed price, the customer gets **Approve the extra cost** in their app (or approves on the technician's phone). No approval, no extra line.
3. Approved parts become lines on the invoice.
4. If the technician paid for the parts, the office pays them back; the receipt photo is the proof.

9. What each role does

Role	New actions
Customer	View or download invoices, see how to pay, tap "I've paid"
Technician	Add parts, collect cash, report a Whish payment made on site, see the cash they hold
Specialist	Confirm Whish payments, record cash handed in, chase unpaid invoices
Admin	All of the above, plus settings, voiding invoices, write-offs, monthly export for the accountant (Excel: every invoice and payment)

10. New emails

When	To
Invoice issued	Customer, with the Whish instructions
Payment reported	Staff ("to confirm")
Payment confirmed	Customer, with the receipt
Payment not found	Customer
Reminder (unpaid)	Customer

11. Limits without the Whish API

- **Manual confirmation:** someone checks the Whish app, ideally twice a day.
- **The customer waits** for that check before seeing "Paid".
- **Forgotten note:** if the customer forgets the BR-number, the office matches by amount and time.
- **Later, with the API:** only section 5 changes. The site makes the Whish link itself and Whish's confirmation marks the invoice Paid. Nothing built now is wasted.

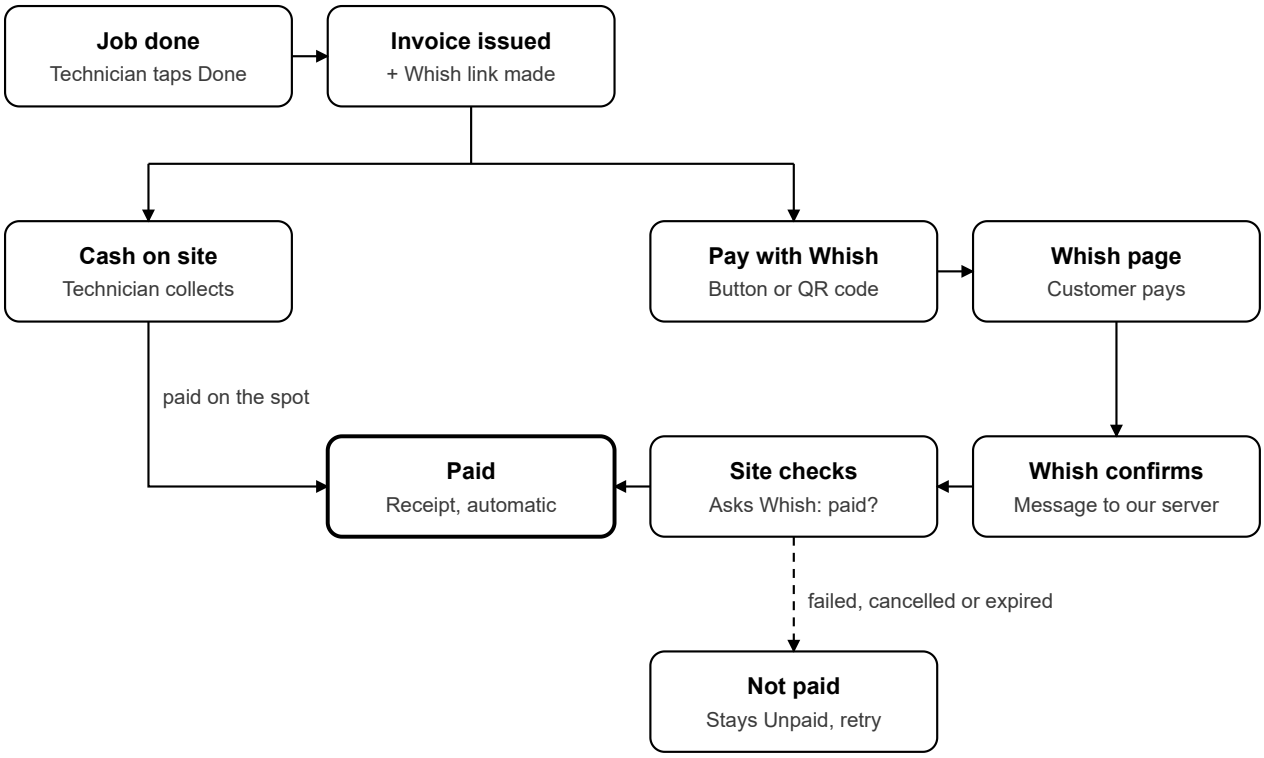

12. What would be built

- **Data:** invoices, invoice lines, payments, cash handovers, settings.
- **Pages:** invoice page with PDF (EN and AR), Collect payment (technician), Parts used, Payments tab (To confirm, Cash, Unpaid), Admin settings, monthly export.
- **Rules:** numbering in order, void instead of edit, only the office confirms Whish, every action logged.

Option B: with the Whish API

Only the Whish part changes. Sections 1, 2, 3, 4A (cash), 6, 7, 8, 10 and 12 of Option A stay the same; sections 4B to 4D and 5 are replaced by what follows.

With the API, Whish tells the site and the invoice turns Paid by itself

B1. What Be Right needs from Whish

- **A merchant account with API access** (not only a business wallet).
- **API keys**: kept on the server (Netlify settings), never in the app or the website code.
- **The documentation** for: create a payment, check a payment's status, verify Whish's messages (signature), refunds.
- **A test (sandbox) account**, to try every case before real money.
- **Our confirmation address registered with Whish**, for example be-rightbright.com/api/whish/confirm.
- **Their fees** per payment, and how fast the money reaches Be Right's account.

B2. How a Whish payment works

1. **Invoice issued:** the site asks Whish to create a payment for it (amount, currency, invoice number). Whish returns a payment link, saved on the invoice.
2. **The customer sees "Pay with Whish"**: a button on the invoice page in My requests and in the invoice email. On site, the technician's phone shows the same link as a QR code.
3. **The customer pays on Whish's page** (the Whish app opens), then comes back to a Be Right page: "Thank you, we're confirming your payment".
4. **Whish sends a message to Be Right's server.** The server never trusts it alone: it checks Whish's signature, then asks Whish "is this payment really done?".
5. **Amount and invoice match: Paid.** The receipt is emailed at once. Nobody in the office has to do anything.
6. **Failed, cancelled or expired:** the invoice stays Unpaid; the customer can try again (the site makes a new link if the old one expired).

B3. What changes for each role

Role	With the API
Customer	One button: Pay with Whish. Sees Paid within seconds. No invoice number to type, no "I've paid".
Technician	Shows the QR code; the job turns Paid on their screen by itself. Cash works as in Option A.
Specialist / admin	No more "Payment to confirm" for link payments. The Payments tab shows only exceptions (B4).

B4. Exceptions the office still handles

- **Amount doesn't match** the invoice (rare): shown to the office to check.
- **A customer sends money by plain Whish transfer** instead of the link: handled as in Option A (Payment to confirm).
- **Refunds:** an admin presses Refund (if Whish's API allows it); otherwise refunded in the Whish app and recorded by hand.
- **Whish is down:** the button shows "Try again later"; cash and plain transfer still work.

B5. Safety rules

- The API keys stay on the server only.
- Every message from Whish is checked (signature) and confirmed with Whish before an invoice turns Paid.
- The amount and invoice number must match; otherwise it goes to the office.
- The same Whish payment is never counted twice, even if Whish sends its message again.
- Every message and every status change is logged.

B6. Option A or Option B

	A: without the API	**B: with the API**
Whish confirmation	By hand, by the office (ideally twice a day)	Automatic, in seconds
Customer sees Paid	After the office checks	Right after paying
Office work	Check every Whish payment	Only exceptions
Mistakes	Forgotten note: matched by hand	None: the link belongs to one invoice
Needs from Whish	A business account	Merchant API access, documentation, test account
Fees	Normal Whish transfer	Whish merchant fee (ask Whish)
Can start	Now	When Whish gives API access
Extra to build	Nothing	Whish connection: create payment, confirmation, status check, refunds

Suggested path: start with A now, so every job has an invoice from day one. Ask Whish for API access in parallel; when it arrives, switch to B. Only the Whish part changes; nothing built for A is wasted.

To decide before building

1. VAT on or off (and what an invoice must show legally): _____
2. Currency: USD only, or USD + LBP: _____
3. Be Right's Whish business number: _____
4. Who pays for parts: the technician (paid back) or a Be Right account: _____
5. How often technicians hand in cash: _____
6. Reminder days for unpaid invoices: _____
7. Ask Whish: API access, documentation, test account, fees, settlement time: _____
8. Start with A, or wait for B: _____
