1. Customer: a repair request

Nothing is sent or charged before the customer approves the price

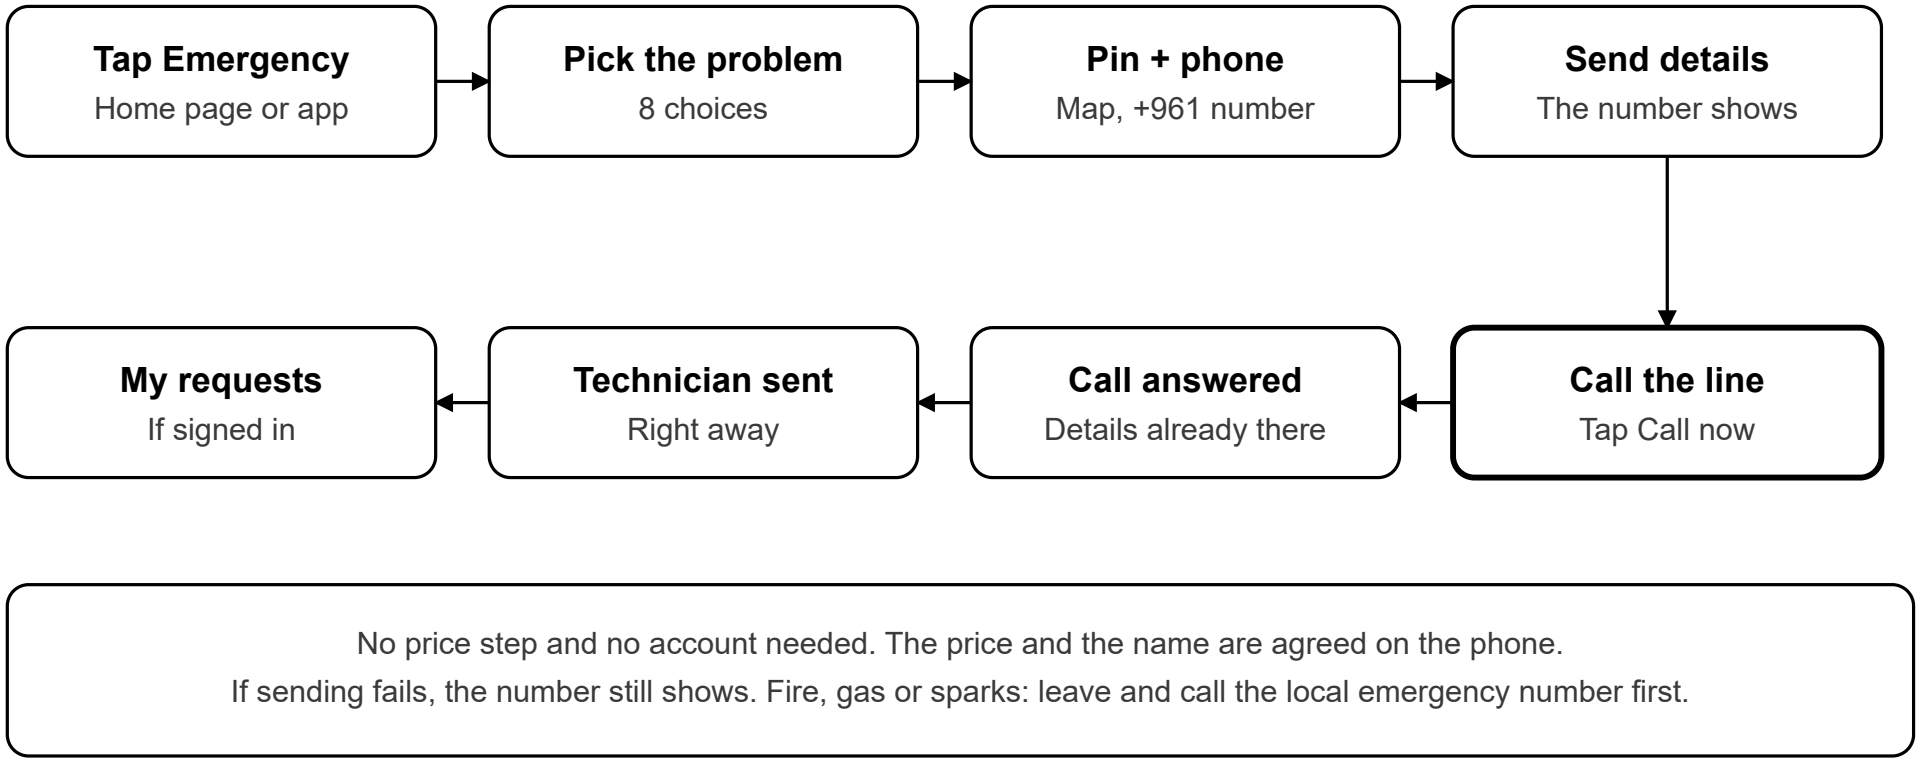

- Top row left to right, then the bottom row back. Thick box: the step where the customer says yes.
- Dashed lines: a job that ends without a repair. A guarantee claim opens a new request linked to the old job.

2. Customer: an emergency

In an emergency the customer sends where they are, then calls

The 8 problems: leak, blocked toilet, locked out, broken door or window, no power, roof, no hot water, other.

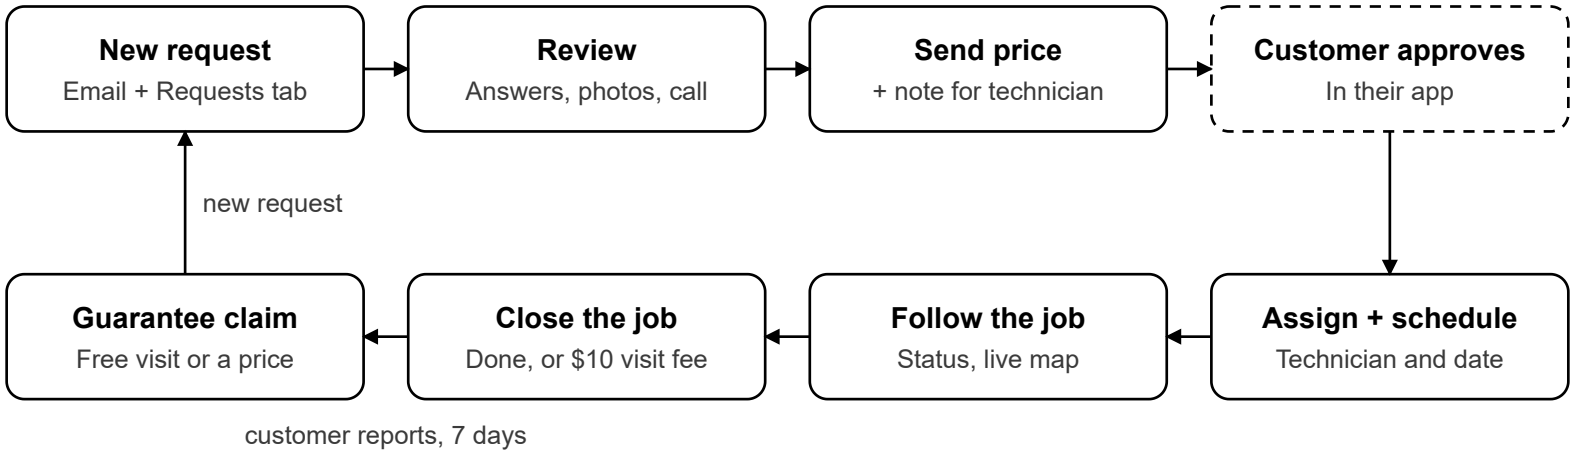

- Thick box: the call. The specialist already has the problem, the map pin and the phone when they answer.
- Sent emergencies are deleted after 90 days.

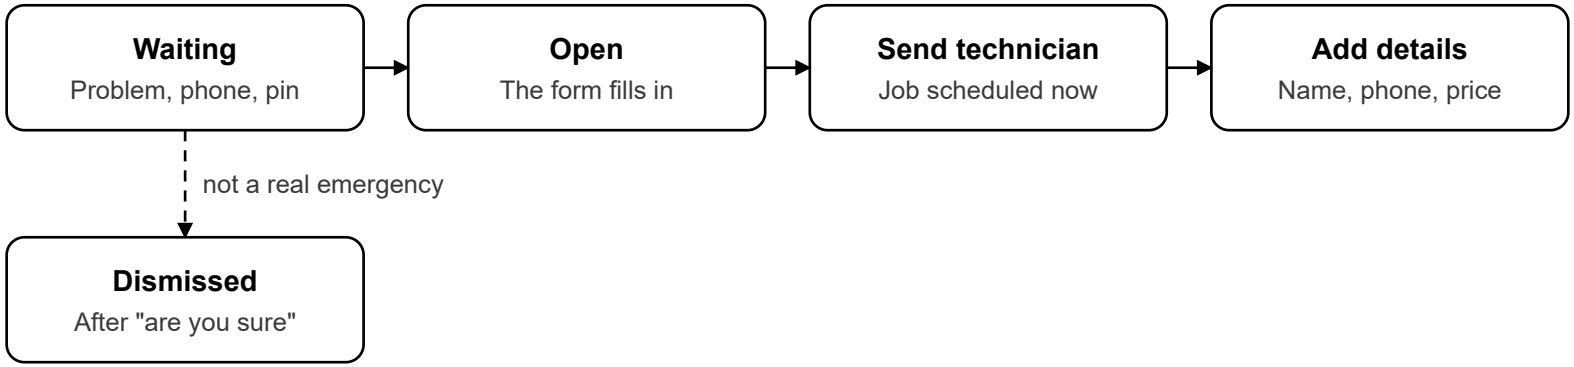

3. Specialist

The specialist turns each request into a scheduled job

Requests tab. The dashed box is the customer's step, not the specialist's.

Emergencies Emergencies tab, refreshes every 15 seconds

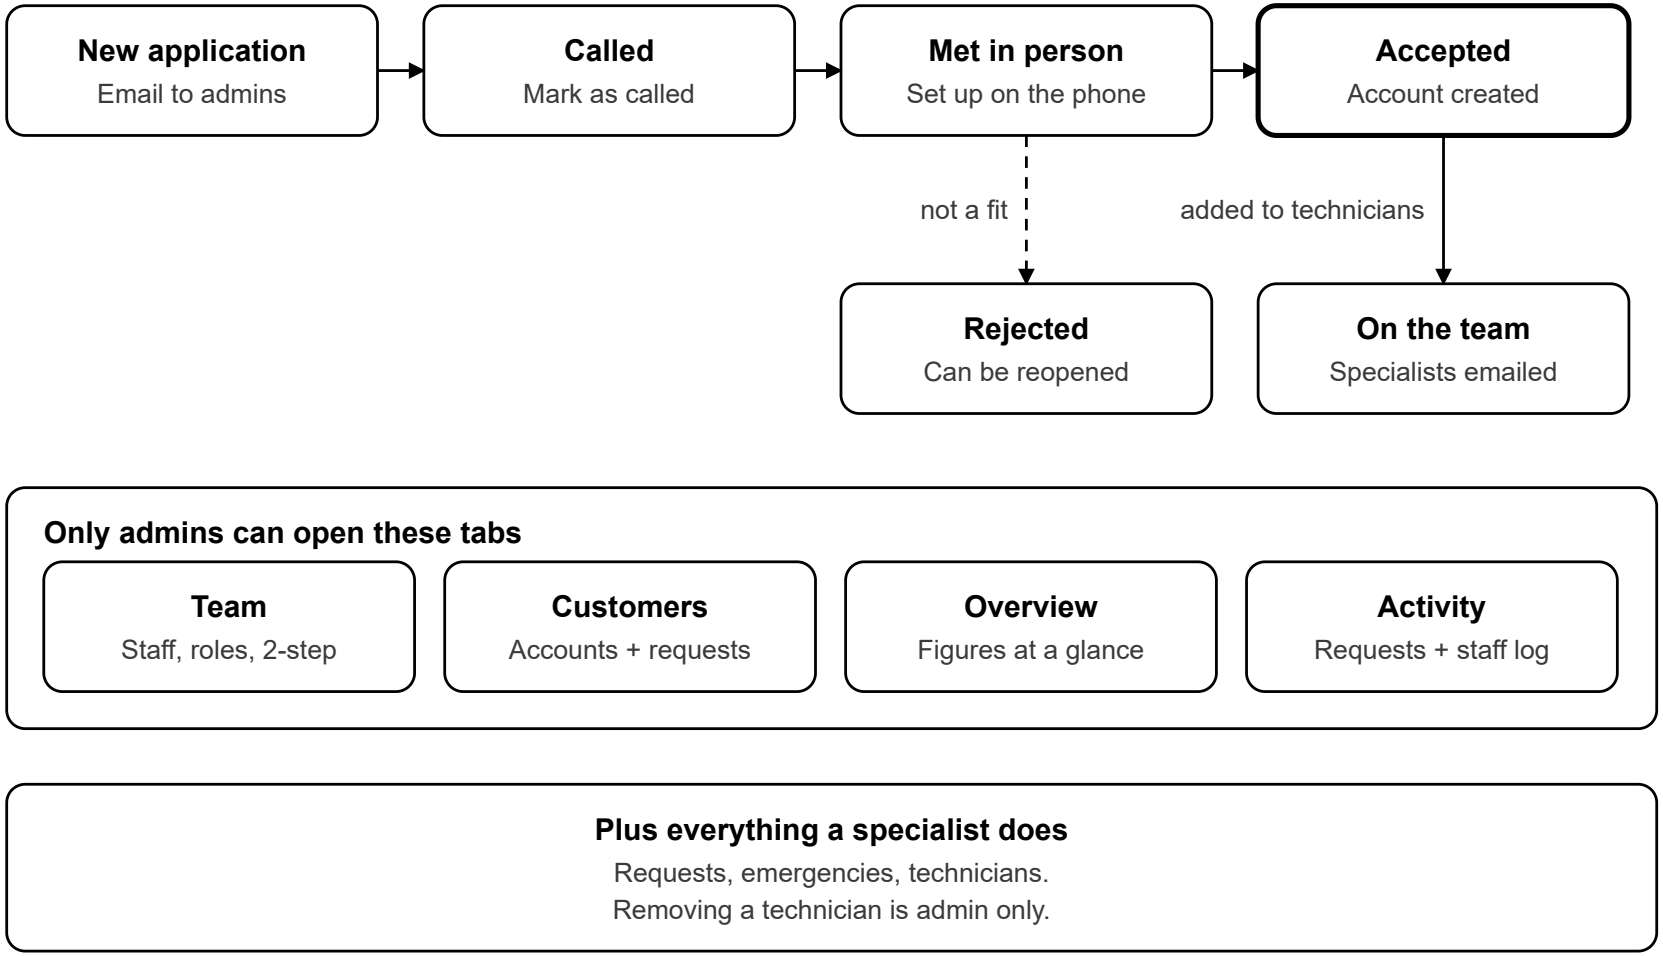

- At any open step the specialist can close a request with a reason.
- In the Technicians tab they only look: no remove, no documents.

4. Admin

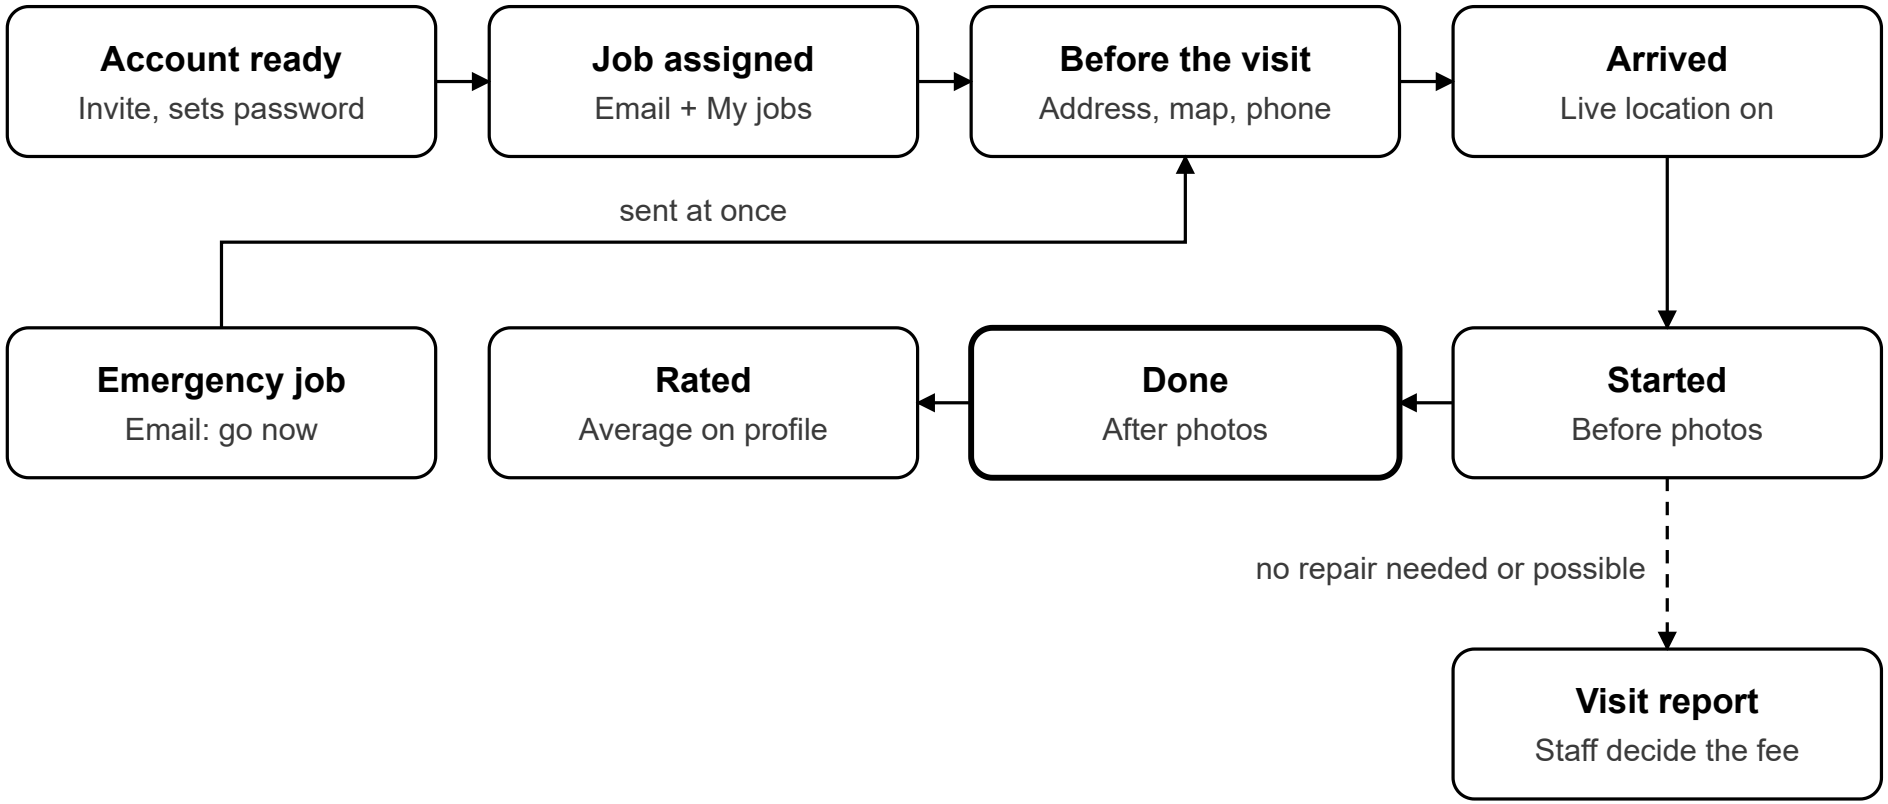

Admins hire technicians and run the team, on top of the specialist work

Hiring a technician, in the Applications tab

- Accepted creates the technician account and invites them to set a password.
- Removing a technician turns them back into a customer; their unscheduled jobs return to the queue.

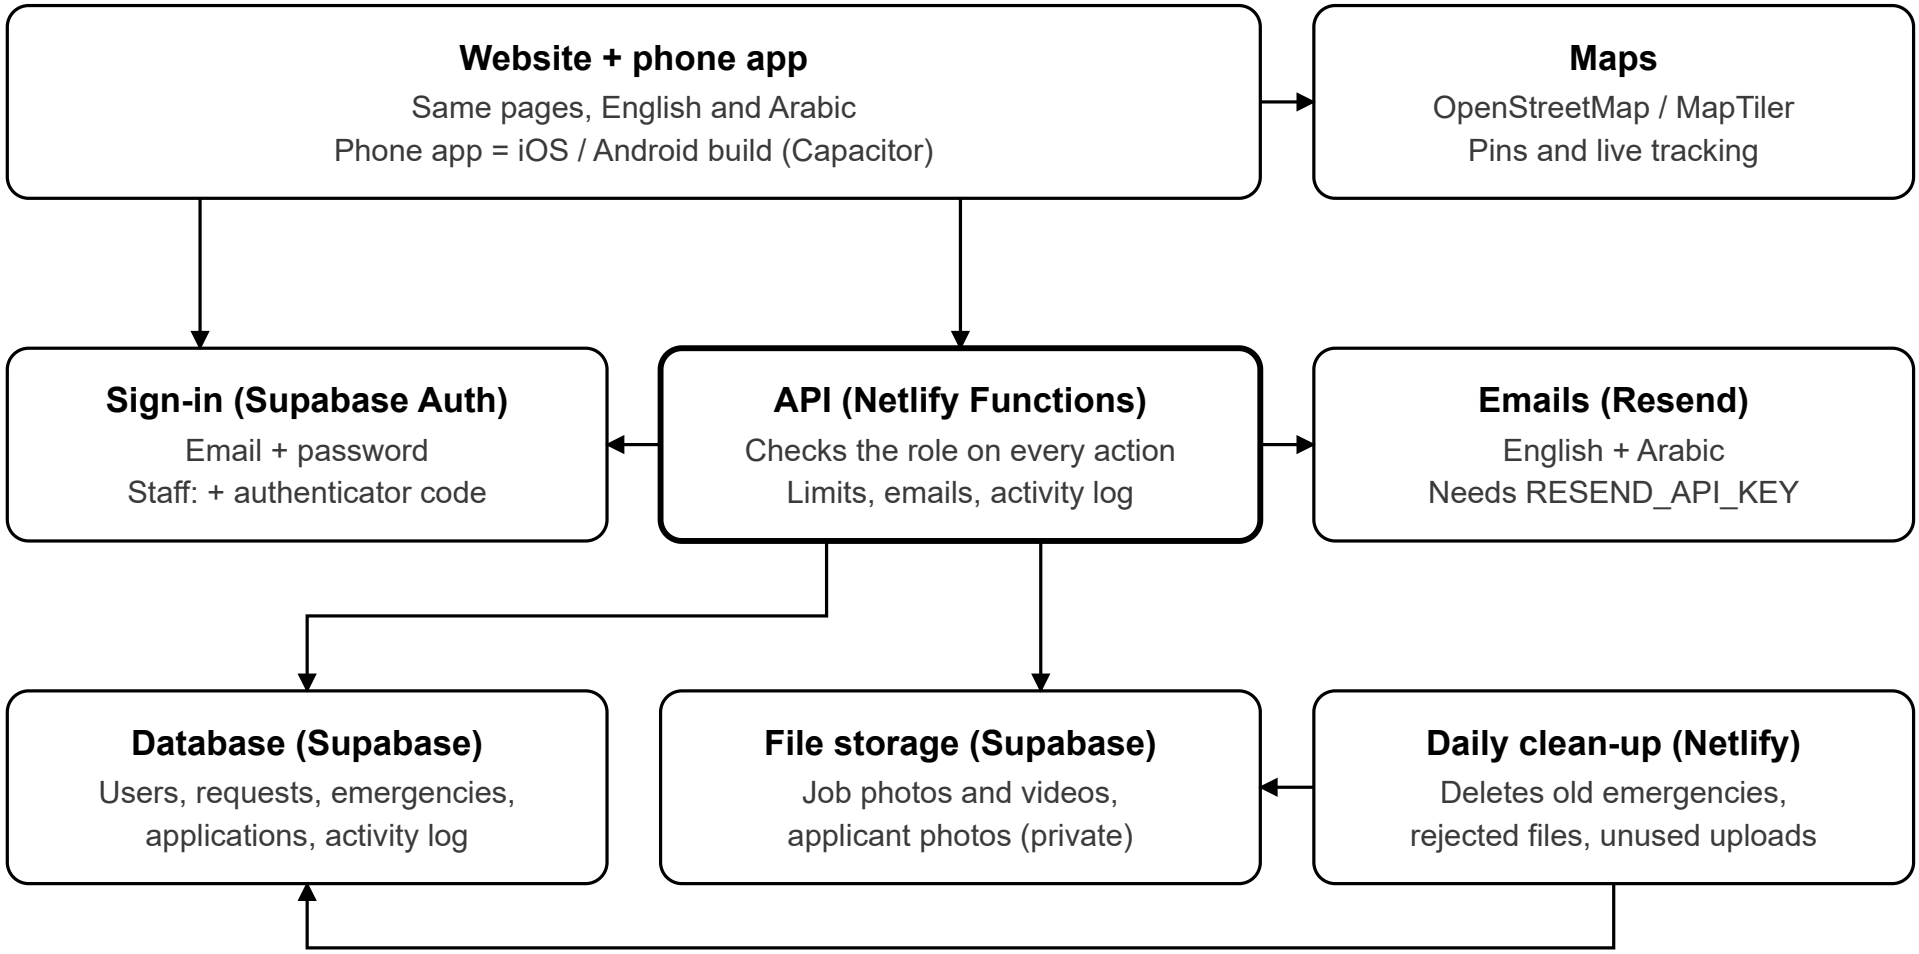

A technician sees only the jobs assigned to them

- The location is shared only while a job is Scheduled or In progress.
- On an emergency job the customer's phone can arrive later; the technician gets an email when it does.

6. System links

Every action goes through the API, which checks the role first

- Photos are uploaded straight to storage with a one-time link the API hands out.
- The website is hosted on Netlify; the domain and visit statistics are on Cloudflare.
